

Introduction to cloud storage services

Task-1. Create a new S3 bucket in your AWS account with a unique name that includes your initials and the current date (e.g., mybucket-AB-20240618). Set the region to Asia Pacific (Mumbai).

1. Open the [AWS Management Console](#) and sign in.

2. Search for **S3** → **Create bucket**.

3. Use a unique name such as:
mybucket-dm-05102026

4. Under **AWS Region**, select **Asia Pacific (Mumbai) — ap-south-1**.

5. Leave the other settings at their defaults unless your instructor specifies otherwise.

6. Click **Create bucket**.

Task-2. Upload three different files (an image, a PDF, and a text file) to your new S3 bucket using the AWS Management Console. Make sure each file has a meaningful name related to your favorite app (e.g., instagram-logo.png, spotify-playlist.pdf, zomato-menu.txt).

Open your new bucket → **Upload** → **Add files** and select three different files, for example:

- downloads.png — image
- abc.pdf — PDF
- newfile.txt — text file

Click **Upload** and verify that all three objects appear in the bucket

Task-3. Set the access permissions on one of your uploaded files so it is publicly accessible via a URL. Test the link in your browser to confirm it works. Use the 'Make public' option in the AWS S3 console and copy the object URL.

For example, select download.png:

1. Open the object.
2. Choose **Actions** → **Make public** if that option is available.
3. Confirm the operation.
4. Copy the **Object URL**.
5. Open the URL in a private/incognito browser window to test it.

6. 

7. 

Task-4. Enable versioning on your S3 bucket, then upload a new version of one of your files (e.g., upload an updated zomato-menu.txt with different content). Check the version history to confirm both versions are stored. Use the 'Versions' tab in the bucket to view all versions.

- ❑ Return to the bucket's **Properties**.
- ❑ Find **Bucket Versioning**.
- ❑ Click **Enable** and save the change.
- ❑ Return to **Objects**.
- ❑ Upload a replacement zomato-menu.txt with different content.
- ❑ Turn on **Show versions** in the object list.
- ❑ You should now see **two versions** of zomato-menu.txt, each with a different version ID

Task-5. Write a short comparison (3-4 sentences) explaining the main differences between AWS S3, EBS, and Glacier. Mention which one you would use for storing Instagram profile pictures, Flipkart order history, and old IRCTC booking records, and why.

AWS S3 is object storage designed for files such as images, documents, and other data that applications need to access over the network. **Amazon EBS** is block storage attached to EC2 instances and is better suited for operating systems, databases, and applications that need a disk-like volume. **Amazon S3 Glacier** is intended for low-cost, long-term archival storage where retrieval is less frequent and may take longer. I would use **S3** for **Instagram profile pictures**, **EBS** for a **database containing frequently accessed Flipkart order history**, and **S3 Glacier** for **old IRCTC booking records** that need to be retained but are rarely accessed.
